## **Database Implementation**

GCP Database Tables - "Screenshot of connection (terminal/command-line information)"

#### DDL commands for tables

CREATE TABLE Users(UserId INT PRIMARY KEY, UserName VARCHAR(30) NOT NULL, Password VARCHAR(30) NOT NULL, FirstName VARCHAR(255) NOT NULL, LastName VARCHAR(255) NOT NULL, Email VARCHAR(255) NOT NULL);

CREATE TABLE Brands(BrandId INT PRIMARY KEY, BrandName VARCHAR(255) NOT NULL, BrandRating REAL);

CREATE TABLE Products(ProductId VARCHAR(64) PRIMARY KEY, ProductName VARCHAR(255) NOT NULL, Size VARCHAR(128), Price INT, LikeCount INT, BrandId INT NOT NULL, FOREIGN KEY (BrandId) REFERENCES Brands(BrandId));

CREATE TABLE Reviews(ReviewId INT PRIMARY KEY, Rating INT, Text VARCHAR(1000), Title VARCHAR(255), Date DATE, ProductId VARCHAR(64) NOT NULL, FOREIGN KEY (ProductId) REFERENCES Products(ProductId));

CREATE TABLE Tags(TagId INT PRIMARY KEY, TagName VARCHAR(64) NOT NULL, Standing INT);

CREATE TABLE BagItems(UserId INT NOT NULL, ProductId VARCHAR(64) NOT NULL, DateAdded DATE, PRIMARY KEY (UserId, ProductId), FOREIGN KEY (UserId) REFERENCES Users(UserId), FOREIGN KEY (ProductId) REFERENCES Products(ProductId));

CREATE TABLE ProductTags(ProductId VARCHAR(64) NOT NULL, TagId INT NOT NULL, PRIMARY KEY (ProductId, TagId), FOREIGN KEY (ProductId)
REFERENCES Products(ProductId), FOREIGN KEY (TagId) REFERENCES
Tags(TagId));

Screenshot of count query for proof of 1000 rows in three different tables

#### **Products**

```
mysql> SELECT count(*) FROM Products;
+-----+
| count(*) |
+-----+
| 8495 |
+-----+
1 row in set (0.06 sec)
```

#### Reviews

```
mysql> SELECT count(*) from Reviews;
+-----+
| count(*) |
+-----+
| 17170 |
+-----+
1 row in set (0.34 sec)
```

#### Tags

```
mysql> SELECT count(*) FROM Tags;
+-----+
| count(*) |
+----+
| 4329 |
+----+
1 row in set (0.00 sec)
mysql>
```

## Advanced Queries + Indexing Analysis

#### **Query 1:** Most Popular Products (Products found most frequently in user bags)

SELECT Pro.ProductName, B.BrandName, Subquery.TimesBagged
FROM (SELECT Bag.ProductId, COUNT(Bag.ProductId) as TimesBagged FROM BagItems
Bag GROUP BY Bag.ProductId) Subquery LEFT OUTER JOIN Products Pro ON
Pro.ProductId = Subquery.ProductId LEFT OUTER JOIN Brands B ON B.BrandId =
Pro.BrandId WHERE (Subquery.TimesBagged >= 0.8 \* (SELECT
MAX(Subquery2.TimesBagged) FROM (SELECT Bag.ProductId, COUNT(Bag.ProductId) as
TimesBagged FROM BagItems Bag GROUP BY Bag.ProductId) Subquery2));

#### **Output:** Only 6 Most Popular Products in User bags (this table grows with user activity)

#### **EXPLAIN ANALYZE Performance before adding indexes:**

**Total Cost**: 51.07 + 30.77 + 57.12 + 51.73 + 52.45 + 35.05 + 17.65 + 74.53 + 57.12 + 52.45 + 35.05 + 17.65 + 0.25 + 0.25 = 533.14

### **Indexing Design 1**

- New Index:
   CREATE INDEX idx Products ProductName ON Products(ProductName);
- EXPLAIN ANALYZE screenshot of this indexing design

```
-+
|-> Nested loop left join (cost=51.07 rows=58) (actual time=0.314..0.356 rows=6 loops=1)
|-> Nested loop left join (cost=30.77 rows=58) (actual time=0.304..0.334 rows=6 loops=1)
|-> Filter: (Subquery.TimesBagged >> <acach>(c0.8 * (select #3))) (cost=51.73..10.47 rows=58) (actual time=0.291..0.303 rows=6 loops=1)
|-> Table scan on Subquery (cost=52.48..57.12 rows=174) (actual time=0.131..0.139 rows=73 loops=1)
|-> Amaterialize (cost=52.45..52.45 rows=174) (actual time=0.129..0.129 rows=73 loops=1)
|-> Coroup aggregate: count (Bag.ProductId) (cost=35.05 rows=174) (actual time=0.037..0.096 rows=73 loops=1)
|-> Coroup aggregate: count (Bag.ProductId) (cost=35.05 rows=174) (actual time=0.037..0.096 rows=73 loops=1)
|-> Select #3 (subquery in condition; run only once)
|-> Aggregate: max(Subquery2 rimesBagged) (cost=74.53..74.53 rows=1) (actual time=0.141..0.141 rows=1 loops=1)
|-> Table scan on Subquery2 (cost=52.48..57.12 rows=174) (actual time=0.122..0.132 rows=73 loops=1)
|-> Table scan on Subquery2 (cost=52.48..57.12 rows=174) (actual time=0.122..0.132 rows=73 loops=1)
|-> Coroup aggregate: count(Bag.ProductId) (cost=0.125 rows=174) (actual time=0.020..0.103 rows=73 loops=1)
|-> Covering index scan on Bag using idx bagitems productid (cost=17.65 rows=174) (actual time=0.001..0.061 rows=179 loops=6)
|-> Single-row index lookup on Pro using PRIMARY (ProductId=Subquery.ProductId) (cost=0.25 rows=1) (actual time=0.005..0.005 rows=1 loops=6)
|-> Single-row index lookup on B using PRIMARY (BrandId=Pro.BrandId) (cost=0.25 rows=1) (actual time=0.003..0.003 rows=1 loops=6)
```

• Total Cost: 51.07 + 30.77 + 51.73 + 57.12 + 52.45 + 35.05 + 17.65 + 74.53 + 57.12 + 52.45 + 35.05 + 17.65 + 0.25 + 0.25 = 533.14

**Pros/Performance Gains**: No significant performance gains. Since the ProductName attribute is not used in the WHERE or GROUP BY clauses, it is most likely that this index does not lead to significant performance gains. It is possible that this index could *slightly* improve performance, given the Products table is so large, and since in this query we are SELECT-ing the ProductName attribute.

A ProductName index could improve performance if we wanted to select specific product names, or order/filter the results of this query by ProductName. For instance, if we wanted to add a new webpage to our app, that would display a list of the most popular products, it would make sense to order the results of this query in descending order.

**Cons/Degradations**: No cons/degradations. ProductId already has an index in the table because it is the Products primary key. Now, we are adding an extra index for the ProductName attribute.

More indices take up more storage space in the BTREE, and add an extra layer of complexity to queries. Since we already have a ProductId index, and we don't order by or group by ProductName, it might not benefit performance significantly to add another index for ProductName

## <u>Indexing Design 2</u>

- New Index:
   CREATE INDEX idx\_Brands\_BrandName ON Brands(BrandName);
- EXPLAIN ANALYZE screenshot of this indexing design

```
+
| -> Nested loop left join (cost=51.07 rows=58) (actual time=0.278..0.320 rows=6 loops=1)
| -> Nested loop left join (cost=30.77 rows=58) (actual time=0.271..0.301 rows=6 loops=1)
| -> Filter: (Subquery.TimesBagged >= <cache>(0.8 * (select #3)))) (cost=51.73..10.47 rows=58) (actual time=0.260..0.272 rows=6 loops=1)
| -> Table scan on Subquery (cost=52.48..57.12 rows=174) (actual time=0.128..0.128 rows=73 loops=1)
| -> Group aggregate: count(Bag.ProductId) (cost=35.05 rows=174) (actual time=0.031..0.098 rows=73 loops=1)
| -> Covering index scan on Bag using idx bagitems productid (cost=17.65 rows=174) (actual time=0.027..0.057 rows=179 loops=1)
| -> Select #3 (subquery in condition; run only once)
| -> Aggregate: max (Subquery2.TimesBagged) (cost=74.53..74.53 rows=1) (actual time=0.112..0.112 rows=1 loops=1)
| -> Table scan on Subquery2 (cost=52.48..57.12 rows=174) (actual time=0.095..0.104 rows=73 loops=1)
| -> Materialize (cost=52.45..52.45 rows=174) (actual time=0.095..0.095 rows=73 loops=1)
| -> Group aggregate: count(Bag.ProductId) (cost=35.05 rows=174) (actual time=0.020..0.077 rows=73 loops=1)
| -> Covering index scan on Bag using idx bagitems productid (cost=17.65 rows=174) (actual time=0.090..0.007 rows=73 loops=1)
| -> Single-row index lookup on Pro using PRIMARY (ProductId=Subquery.ProductId) (cost=0.25 rows=1) (actual time=0.004..0.004 rows=1 loops=6)
| -> Single-row index lookup on B using PRIMARY (Brandid=Pro.Brandid) (cost=0.25 rows=1) (actual time=0.003..0.003 rows=1 loops=6)
```

• Total Cost: 51.07 + 30.77 + 51.73 + 57.12 + 52.45 + 35.05 + 17.65 + 74.53 + 57.12 + 52.45 + 35.05 + 17.65 + 0.25 + 0.25 = 533.14

**Pros/Performance Gains**: No performance gains. Since the BrandName attribute is not used in the WHERE or GROUP BY clauses, it is most likely that this index does not lead to significant performance gains. It is possible that an index for BrandName could *slightly* improve performance, since our query is specifically SELECT-ing the BrandName attribute.

**Cons/Degradations**: No cons/degradations. More indices take up more storage space in the BTREE, and add an extra layer of complexity to queries. Since we already have a Brandld index in the Brands table (Primary key) and in the Products table (foreign key), it might not benefit performance significantly to add an extra index for BrandName. It is probably not useful to index by multiple attributes of the same entity.

### **Indexing Design 3**

- New Index: CREATE INDEX idx\_Products\_Composite ON Products(ProductId, ProductName, BrandId);
- EXPLAIN ANALYZE screenshot of this indexing design

- Total Cost: 51.07 + 30.77 + 51.73 + 57.12 + 52.45 + 35.05 + 17.65 + 74.53 + 57.12 + 52.45 + 35.05 + 17.65 + 0.25 + 0.25 = 533.14
- Pros and cons, performance gains and degradations of this indexing design

**Pros/Performance Gains**: No performance gains. Since the table already has an index on the primary key ProductId by default, and on the foreign key BrandId, it is most likely that a composite index of (ProductId, ProductName, BrandId) consisting of the primary key, selected attribute, and foreign key, is redundant and does not lead to significant performance gains

**Cons/Degradations**: No cons or degradations. More indices take up more storage space in the BTREE, and add an extra layer of complexity to queries. Since we already have a ProductId index in the Products table, it might not benefit performance significantly to add an extra index for a composite set of attributes including the primary key.

## Final Indexing Choice and Why

#### Justification:

ProductId is the primary key of the Products table and already has an index in the table by default.

In this query, the only attribute being used in the WHERE clause and GROUP BY clause is ProductId. Since we are only SELECT-ing ProductName and BrandName, but not filtering by these attributes, we conclude that there is no significant performance gain in indexing on these attributes.

As a result our final indexing choice for this query is to add no additional indexes. We choose the default indexing setup - indexing on the primary key ProductId and on the foreign key BrandId.

In second place is Indexing Design 1 (indexing on ProductName) as in the future, we could extend our query to ORDER BY ProductName, in which case an index on ProductName could lead to performance gains.

## Query 2: User Bag Overview During Friends Search

```
SELECT UserName, COUNT(ProductId) AS NumProductsInBag
FROM Users LEFT OUTER JOIN BagItems ON Users.UserId = BagItems.UserId
GROUP BY (Users.UserId)
ORDER BY LEAST(LEVENSHTEIN(UserName, *search*), LEVENSHTEIN(FirstName, *search*), LEVENSHTEIN(LastName, *search*))
LIMIT 15;
```

Output: example query replaces \*search\* with "kylie"

++	+		
UserName	NumProductsInBag		
1 11

#### **EXPLAIN ANALYZE Performance before adding indexes:**

**Total Cost:** 15.52 + 2.35 + 0.30 = 18.17

Indexing Design 1

- New Index: CREATE INDEX idx\_Users\_UserName ON Users (UserName);
- EXPLAIN ANALYZE screenshot of this indexing design

```
| -> Limit: 15 row(s) (actual time=14.969.14.971 rows=15 loops=1)
-> Sort: least.(LFVENSHTEIN(Users.UserName, kylie'), LEVENSHTEIN(Users.FirstName, 'kylie'), LEVENSHTEIN(Users.LastName, 'kylie')), limit input to 15 row(s) per chunk (actual time=14.968.14.969 rows=15 loops=1)
-> Table scan on ctemporaryy (actual time=14.936.14.940 rows=21 loops=1)
-> Nesteel loop_lett [oin (cost=15.52 rows=73) (actual time=0.338.0.196 rows=73 loops=1)
-> Table scan on Users (cost=2.35 rows=21) (actual time=0.025.0.01 rows=21 loops=1)
-> Covering index lookup on Bagtems using FRIMARY (UserInd-Users.UserInd-Users.UserInd)
-> Covering index lookup on Bagtems using FRIMARY (UserInd-Users.UserInd-Users.UserInd)
-> Covering index lookup on Bagtems using FRIMARY (UserInd-Users.UserInd-Users.UserInd-Users.UserInd-Users.UserInd-Users.UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-UserInd-Use
```

- Total Cost: 15.52 + 2.35 + 0.30 = 18.17
- Pros and cons, performance gains and degradations of this indexing design

We expect no performance improvement or degradation. This is likely due to the fact that Users. UserName is only used in the Levenshtein distance calculation. Due to the primary key

UserId in the User table, and the fact that the UserId is the only attribute being used in the JOIN and GROUP BY clauses, adding an index on the UserName attribute of the Users table will only take up more storage space without improving performance.

#### Indexing Design 2

- New Index: CREATE INDEX idx\_Users\_CoveringIndex ON Users (UserName, FirstName, LastName);
- EXPLAIN ANALYZE screenshot of this indexing design

```
| -> Limit: 15 row(s) (actual time=15.724..15.726 rows=15 loops=1)
-> Sort: least(LEVENSETEIN(Users.estrant):,)LEVENSETEIN(Users.estranthe, 'kylie'), LEVENSETEIN(Users.estranthe, 'kylie'), limit input to 15 row(s) per chunk (actual time=15.723..15.724 rows=15 loops=1)
-> Table scan on <temporary> (actual time=15.699..15.074 rows=21 loops=1)
-> Aggregate using temporary table (actual time=16.697..15.697 rows=21 loops=1)
-> Nested loop left join (cost=15.52 rows=73) (actual time=0.038..0.202 rows=73 loops=1)
-> Covering index scan on Users using idt Users CoveringIndex (cost=0.35 rows=21) (actual time=0.027..0.043 rows=21 loops=1)
-> Covering index lookup on BagItems using FRIMARY (Userd=Users.Userd) (cost=0.30 rows=3) (actual time=0.005..0.008 rows=3 loops=21)
```

- Total Cost: 15.52 + 2.35 + 0.30 = 18.17
- Pros and cons, performance gains and degradations of this indexing design

We expect no performance improvement or degradation. This is likely due to the fact that Users.UserName, Users.FirstName, and Users.LastName are only used in the Levenshtein distance calculations. Due to the primary key Userld in the User table, and the fact that the Userld is the only attribute being used in the JOIN and GROUP BY clauses, adding an index on the UserName, FirstName, and LastName attributes of the Users table will only take up more storage space without improving performance.

#### Indexing Design 3

- New Index: CREATE INDEX idx\_Users\_BagItems\_JoinIndex ON BagItems (UserId, ProductId);
- EXPLAIN ANALYZE screenshot of this indexing design

```
| -> Limit: 15 row(s) (actual time=14.999..15.001 rows=15 loops=1)
-> Sourt: least(LEVENSHTEIN(Users.) persons with time=14.998..14.999 rows=15 loops=1)
-> Table scan on temporary> (actual time=14.997..14.973 rows=21 loops=1)
-> Aggregate using temporary table (actual time=14.967..14.973 rows=22 loops=1)
-> Nested loop left join (cost=15.52 rows=73) (actual time=0.050.0.215 rows=73) loops=1)
-> Table scan on Users (cost=2.35 rows=73) (actual time=0.050.0.215 rows=73) loops=1)
-> Table scan on Users (cost=2.35 rows=73) (actual time=0.050.0.205 rows=21 loops=1)
-> Covering index lookup on Bagitems using PRIMARY (UserId=Users.UserId) (cost=0.30 rows=3) (actual time=0.004..0.007 rows=3 loops=21)
```

- Total Cost: 15.52 + 2.35 + 0.30 = 18.17
- Pros and cons, performance gains and degradations of this indexing design

We expect no performance improvement or degradation. This is likely due to the fact that BagItems.UserId is used in the JOIN clause but is already a primary key, and BagItems.ProductId is not used in the query. Since ProductId is not used in the query, adding an index on it only takes up more storage space without improving performance.

#### Final Indexing Choice and Why

**Justification:** The final index design we chose for Advanced Query #2 is the default index (the primary key Userld in the Users table and the primary/foreign key Userld in the Bagltems table). We chose this index because all of the other indexing designs we tried did not impact the cost of the query. This is because this query simply uses the primary key Userld in both the JOIN and GROUP BY clauses, while any other attributes are simply used in the SELECT or ORDER BY clauses, and thus do not have an effect on the cost.

#### **Query 3:** Users also bagged

```
SELECT BI. ProductId AS OtherPID,
      P.ProductName,
       AVG(R.Rating) AS AverageRating,
       COUNT(R.ReviewId) AS NumberOfReviews
FROM BaqItems BI
    JOIN Products P ON BI.ProductId = P.ProductId
    JOIN
        SELECT ProductId, MAX(ReviewId) AS LatestReviewId
        FROM Reviews
        GROUP BY ProductId
    ) AS LatestReview
        ON BI.ProductId = LatestReview.ProductId
    JOIN Reviews R
        ON LatestReview.LatestReviewId = R.ReviewId
WHERE BI.ProductId != *current-product*
     AND BI.UserId IN (
     SELECT UserId FROM BagItems WHERE ProductId = *current-product*)
GROUP BY BI.ProductId, P.ProductName
ORDER BY BI.ProductId;
```

Output: example query replaces \*current-product\* with 'P501265'

OtherPID	ProductName	AverageRating	NumberOfReviews
 P392235	The Camellia Oil 2-in-1 Makeup Remover & Cleanser	5.0000	15
P429659	Squalane + Hyaluronic Toning Mist	5.0000	1
P438643	The Balance pH Balancing Gel Cleanser	5.0000	1
P441644	Mini Superfood Antioxidant Cleanser	2.0000	1 17
P465741	Wild Huckleberry 8-Acid Polishing Peel Mask	5.0000	1
P480278	Rapid Radiance Set	4.0000	1
P481084	Mini Revitalizing Supreme+ Youth Power Creme Moisturizer	5.0000	17
P481817	Beauty Elixir Prep, Set, Glow Face Mist	4.0000	1
P505020	The POREfessional Good Cleanup Foaming Cleanser	5.0000	1

#### **EXPLAIN ANALYZE Performance before adding indexes:**

Total Cost: 1041.91 + 554.88 + 67.85 + 21.95 + 2.14 + 0.38 + 0.38 + 0.25 + 826.25 + 911.95 + 731.85 + 0.25 = 4160.04

-> Single=row index lookup on R using PRIMARY (ReviewId=LatestReview.LatestReviewId) (cost=0.25 rows=1) (actual time=0.002..0.002 rows=1 loops=55)
```

- Total Cost: 1041.91 + 554.88 + 67.85 + 21.95 + 2.14 + 0.38 + 0.38 + 0.25 + 826.25 + 911.95 + 731.85 + 0.25 = 4160.04
- Pros and cons, performance gains and degradations of this indexing design:

This indexing design is not ideal because it does not significantly enhance the performance for queries where Rating is not used directly for filtering, sorting, or as a crucial part of join conditions, despite its presence in the query output. Although the rating is outputted in the query, it is not directly involved in filtering or sorting and it is not a part of major JOIN operations. Although the output showed no performance gain or degradation, this index has the potential to slow other operations because it would need to be updated based on modifications to the Reviews table. Since this index does not lead to performance gains, it could take up unnecessary storage and slow other operations.

#### Indexing Design 2

- New Index: CREATE INDEX ByName on Products(ProductName);
- EXPLAIN ANALYZE screenshot of this indexing design

```
| >> Sort: Bf.Productid (actual time=16.714..16.715 rows=9 loops=1)
-> Table scan on temporaryy (actual time=16.693..16.694 rows=9 loops=1)
-> Aggregate using temporary table (actual time=16.691.16.691 rows=9 loops=1)
-> Nested loop inner join (cost=019.91 (actual time=15.874..16.61 rows=55 loops=1)

-> Naterialize (cost=911.98..911.99 rows=1801) (actual time=0.110..0.110 rows=0 loops=146)
-> Naterialize (cost=911.98..911.99 rows=1801) (actual time=0.110..0.110 rows=0 loops=146)
-> Covering index skip scan for grouping on Reviews unproducted (cost=03.85 rows=1801) (actual time=0.100..0.100 rows=0 loops=16)
-> Single-row index lookup on Rusing PRIMARY (ReviewId=LatestReview.LatestReviewId) (cost=0.25 rows=1) (actual time=0.001..0.001 rows=1 loops=150)
-> Single-row index lookup on Rusing PRIMARY (ReviewId=LatestReviewId) (cost=0.25 rows=1) (actual time=0.001..0.001 rows=1 loops=55)
```

- Total Cost: 1041.91 + 554.88 + 67.85 + 21.95 + 2.14 + 0.38 + 0.38 + 0.25 + 826.25 + 911.95 + 731.85 + 0.25 = 4160.04
- Pros and cons, performance gains and degradations of this indexing design: This indexing design did not facilitate any performance gains or degradations. The impact of the index remains neutral after the analysis, summarized with a total cost of 4160.04, underscores that this particular indexing design neither improves nor detracts from the query's efficiency. Since ProductName is often referenced in the scope of our application, it could be useful for other queries, but this query does not involve ProductName in major operations. The query identifies distinct products based on ProductId, not based on ProductName, so the index does not affect the cost.

#### Indexing Design 3

- New Index: CREATE INDEX ByProduct on Products(ProductId, ProductName);
- EXPLAIN ANALYZE screenshot of this indexing design

- Total Cost: 1041.91 + 554.88 + 67.85 + 21.95 + 2.14 + 0.38 + 0.38 + 0.25 + 826.25 + 911.95 + 731.85 + 0.25 = 4160.04
- Pros and cons, performance gains and degradations of this indexing design: There was no performance gain or degradation due to the creation of this index. Although the output depicted no change in cost, this indexing design has the most potential to induce performance improvement. Since ProductId is a part of this index, the database will utilize this index for the JOIN operation. One con is that indexing with multiple columns consumes more storage space and manages more data, so applying a modification may be more costly. Specifically, due to the inclusion of two columns, updates to either ProductId or ProductName would necessitate index maintenance.

#### Final Indexing Choice and Why

 Report on the final index design you selected and explain why you chose it, referencing the analysis you performed:

After thorough analysis, none of my indexing designs (ByRating, ByName, and ByProduct) demonstrated any performance improvement for the query. As a result, I would not select any of the indexing designs because they would take up more storage space rather than saving cost. Specifically, the indexes on Rating and ProductName did not align with the primary attributes used in critical operations such as joins and filtering. Due to this, the indices did not impact the cost. Although the last indexing design had one column that indexed on ProductId, this still did not display any explicit performance gain or degradation, so I will not select this indexing design.

# **Query 4:** Aggregations for common products bagged between the application user and the user's bag they are viewing

SELECT BI1.UserId AS UserId1,BI2.UserId AS UserId2, COUNT(BI1.ProductId) AS SharedProductsCount,GROUP\_CONCAT(DISTINCT P.ProductName ORDER BY P.ProductName SEPARATOR ', ') AS SharedProductNames,AVG(P.Price) AS AveragePriceOfSharedProducts

```
FROM BagItems BI1
JOIN BagItems BI2 ON BI1.ProductId = BI2.ProductId AND BI1.UserId <
BI2.UserId
JOIN Products P ON BI1.ProductId = P.ProductId
GROUP BY BI1.UserId, BI2.UserId
HAVING COUNT(BI1.ProductId) > 0
LIMIT 15;
```

#### **Output:**

#### **EXPLAIN ANALYZE Performance before adding indexes:**

**Total Cost:** 153.87+153.87+105.49+17.65+0.27+0.27 + 0.25= 431.67

#### Indexing Design 1

- New Index: CREATE INDEX idx\_bagitems\_productid ON BagItems(ProductId);
- EXPLAIN ANALYZE screenshot of this indexing design

```
| >> Filter: (count(BagItems.ProductId) > 0) (actual time=3.444.3.979 rows=171 loops=1)
-> Group aggregate: count(BagItems.ProductId), count(BagItems.ProductId), group_concat(distinct Products.ProductName order by Products.ProductName ASC separator ', '), avg(Procts.Price) (actual time=3.442.3.362 rows=171 loops=1)
-> Sort: B11.Userid, B12.Userid (actual time=3.422.3.507 rows=861 loops=1)
-> Stream results (cost=153.87 rows=138) (actual time=0.210.3.177 rows=861 loops=1)
-> Nested loop inner join (cost=153.87 rows=138) (actual time=0.207.2.689 rows=861 loops=1)
-> Nested loop inner join (cost=105.49 rows=138) (actual time=0.208.2.284 rows=861 loops=1)
-> Covering index soon on B11 using idx bagitems productid (cost=17.65 rows=174) (actual time=0.163.0.207 rows=179 loops=1)
-> Filter: (Bil.Userid < B12.Userid) (cost=0.27 rows=1) (actual time=0.009.0.0.011 rows=5 loops=179)
-> Covering index lookup on B12 using idx bagitems productid (ProductId=B11.ProductId) (cost=0.27 rows=2) (actual time=0.006.0.001 rows=11 loops=861)
-> Single=row index lookup on F using FRIMARY (ProductId=B11.ProductId) (cost=0.25 rows=1) (actual time=0.000.0.0.000 rows=1 loops=861)
```

- Total Cost: 153.87+153.87+105.49+17.65+0.27+0.27 + 0.25= 431.67
- Pros and cons, performance gains and degradations of this indexing design

There are no performance improvements or degradations for this index. This is most likely because ProductId is both a primary key and a foreign key to another table, so it is possible that, being a primary key, it already provided sufficient indexing for the query's needs without the index. Being that ProductId is also a foreign key in BagItems, this index is now tied to a foreign key constraint and will not be removed. The indexing design is used in the query's execution plan, and does not have any negative effects on the performance of the query.

#### Indexing Design 2

- New Index: CREATE INDEX idx products productname ON Products(ProductName);
- EXPLAIN ANALYZE screenshot of this indexing design

```
| -> Filter: (count(BagItems.ProductId) > 0) (actual time=2.702..3.273 rows=171 loops=1)
-> Group aggregate: count(BagItems.ProductId), count(BagItems.ProductId), group_concat(distinct Products.ProductName order by Products.ProductName ASC separator ', '), avg(Procts.Price) (actual time=2.01..3.256 rows=171 loops=1)
-> Sort: Bill.OserId, BIZ.OserId (actual time=2.684..2.790 rows=861 loops=1)
-> Stream results (cost=153.87 rows=138) (actual time=0.055..2.426 rows=861 loops=1)
-> Nested loop inner join (cost=155.87 rows=138) (actual time=0.055..1.943 rows=861 loops=1)
-> Nested loop inner join (cost=105.49 rows=138) (actual time=0.055..1.943 rows=861 loops=1)
-> Covering index soon on Bil using idx bagitems productid (actual time=0.027..0.063 rows=179 loops=1)
-> Filter: (Bill.UserId < BiZ.UserId) (cost=0.27 rows=1) (actual time=0.005..0.008 rows=5 loops=179)
-> Covering index lookup on BiZ using idx bagitems productid (ProductId-Bill.ProductId) (cost=0.27 rows=2) (actual time=0.002..0.007 rows=1 loops=179)
-> Single-row index lookup on P using FRIMARY (ProductId-Bill.ProductId) (cost=0.25 rows=1) (actual time=0.000..0.000 rows=1 loops=861)
```

- Total Cost: 153.87+153.87+105.49+17.65+0.27+0.27 + 0.25= 431.67
- Pros and cons, performance gains and degradations of this indexing design
  - There are no performance improvements or degradations for this index. It can be seen above that the query's execution plan doesn't use the index at all. This could be because the computational cost is heavily dominated by something other than retrieving or sorting by ProductName, so the impact of indexing on ProductName is negligible and the ProductName isn't much of a limiting factor.

#### Indexing Design 3

- New Index: CREATE INDEX idx\_products\_productname\_price ON Products(ProductName, Price);
- EXPLAIN ANALYZE screenshot of this indexing design

```
| -> Filter: (count(BagItems.ProductId) > 0) (actual time=2.744...3.310 rows=171 loops=1)
-> Foroup aggregate: count (BagItems.ProductId) count(BagItems.ProductId), group_concat (distinct ProductS.ProductName order by Products.ProductName ASC separator ', '), avg(Products.Price) (actual time=2.743...3.292 rows=171 loops=1)
-> Sort: BII.UserId, BIZ.UserId (actual time=0.66...2.476 rows=861 loops=1)
-> Stream results (notes 1.57 rows=1.58) (cots 1.58 rows=1.58
```

- Total Cost: 153.87+153.87+105.49+17.65+0.27+0.27 + 0.25= 431.67
- Pros and cons, performance gains and degradations of this indexing design
  - There are no performance gains and degradations for this indexing design. The
    query's execution plan doesn't use this indexing design either. Indexing
    ProductName and Price together did not outperform the current execution plan
    significantly enough, which could mean the cost of using the index may have
    outweighed the performance benefits.

#### Final Indexing Choice and Why

 Report on the final index design you selected and explain why you chose it, referencing the analysis you performed In the final index design, we will be using Indexing Design 1 and not using Indexing Design 2 and 3. Although Indexing Design 1 doesn't change the computational cost, the index cannot be removed without changing the entire database due to a Foreign Key constraint. It is utilized in the query's execution plan, therefore we decided to continue using it. It also does not affect the total cost negatively. We will not be using index designs 2 and 3 because the impact of them is clearly negligible, and using the index designs will not outperform a full table scan when executing the query. This is likely due to another part of the query taking up the majority of the computational cost. Using the GROUP\_CONCAT function in this query was likely very costly and time consuming compared to the indexes attempted, however there is little indexing that can be done to lower the cost of the GROUP\_CONCAT usage.

# **Appendix**

#### QUERIES IN PROGRESS/OLD QUERIES

#	Advanced query	Screenshot of max(15, query result) rows of advanced query results
1	Average Rating // SELECT "P132239" FROM  SELECT ProductId, AVG(Rating), COUNT(Rating) AS NumRatings FROM Products Pro JOIN Reviews Rev ON Pro.ProductId = Rev.ProductId GROUP BY ProductId;	On the Products page, to display these stats  AAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAA
4a	Seeing how many items from each brand a user has in their bag:  SELECT U.Userld, U.FirstName, U.LastName, COUNT(BI.ProductId) AS	

ProductCount, P.BrandId FROM Users U JOIN BagItems BI ON U.UserId = BI.UserId JOIN Products P ON BI.ProductId = P.ProductId GROUP BY U.Userld, P.Brandld HAVING COUNT(BI.ProductId) > 3 LIMIT 15; 4b Comparing one user's bag to another user's to see how many items they have similar: SELECT BI1.UserId AS User1, BI2.UserId AS User2, COUNT(BI1.ProductId) AS SharedProductCount FROM BagItems BI1 JOIN BagItems BI2 ON BI1.ProductId = BI2.ProductId AND BI1.UserId <> BI2.UserId WHERE BI1.UserId = 18 AND B12.UserId = 6GROUP BY BI1.UserId, BI2.UserId HAVING COUNT(BI1.ProductId) > 2 LIMIT 15;
